

SRI INDU COLLEGE OF ENGINEERING AND TECHNOLOGY
DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING
HANDS ON TRAINING COURSE
ON
ANGULAR JS PROGRAMMING

Date: From 23.02.2022 To 31-03-2022 (6 Week Course, Only on Saturdays)

COURSE CONTENTS

MODULE -1		
Durations	Topics	Resource Person
Week 1	Introduction to Angular JS programming	Mr.D.Prasanth
	(integer, float, Boolean, string, etc)	
	Angular JS Modules:	
	Functions & Modules	
	Angular Beginner Projects	
	Angular for Adding a Directive	
	Assignment-1	
Week 2	Modules and Controllers in Files	Mr.D.Prasanth
	myApp.js	
	myCtrl.js, Angular JS Controllers,	
	Assignment-2	
Week 3	Controller Methods	Mr.D.Prasanth
	Angular JS Forms	
	Data-Binding, Checkbox	
	Angular JS \$http	

MODULE -2		
Durations	Topics	Resource Person
Week 4	Angular JS Example	Mr.D.Prasanth
	Server Code Examples	
	Server Code PHP	
	MySQL	
	Reading Relational Tables	
	Assignment-4	
MODULE -3		
Durations	Topics	Resource Person
Week 5	Creating a Chart	Mr.D.Prasanth
	Formatting Line type and Colour	
	Drawing a 3D Plot	
	Applying Aggregations on Data Frame	
Week 6	Input as CSV File	Mr.D.Prasanth
	Assessment -2	
	Conclusion	

Angular JS

Angular JS is a **JavaScript framework**. It can be added to an HTML page with a <script> tag. Angular JS extends HTML attributes with **Directives**, and binds data to HTML with **Expressions**. Angular JS is a JavaScript Framework Angular JS is a JavaScript framework. It is a library written in JavaScript.

Angular JS is distributed as a JavaScript file, and can be added to a web page with a script tag:
<script src="https://ajax.googleapis.com/ajax/libs/Angular JS/1.4.8/angular.min.js"></script>
Angular JS Extends HTML

Angular JS extends HTML with **ng-directives**.

The **ng-app** directive defines an Angular JS application.

The **ng-model** directive binds the value of HTML controls (input, select, textarea) to application data.

The **ng-bind** directive binds application data to the HTML view. Angular JS Example

```
<!DOCTYPE html>
<html>
<script src="https://ajax.googleapis.com/ajax/libs/Angular JS/1.4.8/angular.min.js"></script>
<body>

<div ng-app="">
  <p>Name: <input type="text" ng-model="name"></p>
  <p ng-bind="name"></p>
</div>

</body>
</html>
```

Example explained:

Angular JS starts automatically when the web page has loaded.

The **ng-app** directive tells Angular JS that the <div> element is the "owner" of an Angular JS application.

The **ng-model** directive binds the value of the input field to the application variable **name**.

The **ng-bind** directive binds the **inner HTML** of the <p> element to the application variable **name**.

Directives

, Angular JS directives are HTML attributes with an **ng** prefix

Angular JS Example

The screenshot shows a web browser window with the URL http://www.w3schools.com/angular/tryit.asp?filename=try_ng_model. The browser toolbar includes File, Edit, View, Favorites, Tools, and Help. The main content area has a title "Web Design and Marketing" and a subtext "We raise you above the competition to increase sales and recognition. Go to cardamonemarketing.com". Below the title is a "Run" button. The left panel displays the following HTML code:

```
<!DOCTYPE html>
<html>
<script
src="https://ajax.googleapis.com/ajax/libs/angularjs/1.4.8/angular.min.js"></script>
</body>

<div ng-app="">
<p>Input something in the input box:</p>
<p>Name: <input type="text" ng-model="name"></p>
<p ng-bind="name"></p>
</div>
</body>
</html>
```

The right panel shows the result of running the code. It contains an input box with the placeholder "Input something in the input box:" and a value "Name: Joanne Hunter". Below the input box is the output "Joanne Hunter". The status bar at the bottom right indicates "Result Size: 704 x 577".

Angular JS controllers **control the data** of Angular JS applications. Angular JS controllers are regular **JavaScript Objects**.

Angular JS Modules

An Angular JS module defines an application.

The module is a container for the different parts of an application. The module is a container for the application controllers.

Controllers always belong to a modul

Creating a Module

A module is created by using the Angular JS function `angular.module`

```
<div ng-app="myApp">...</div>

<script>

var app = angular.module("myApp", []);

</script>
```

The "myApp" parameter refers to an HTML element in which the application will run.

Now you can add controllers, directives, filters, and more, to your Angular JS application.

Adding a Controller

Add a controller to your application, and refer to the controller with the `ng-controller` directive:

Example

```
<div ng-app="myApp" ng-controller="myCtrl">
{{ firstName + " " + lastName }}
</div>

<script>

var app = angular.module("myApp", []);

app.controller("myCtrl", function($scope) {
    $scope.firstName = "John";
    $scope.lastName = "Doe";
});

</script>
```

Adding a Directive

Angular JS has a set of built-in directives which you can use to add functionality to your application.

For a full reference, visit our [Angular JS directive reference](#).

In addition you can use the module to add your own directives to your applications:

Example

```
<div ng-app="myApp" w3-test-directive></div>

<script>
var app = angular.module("myApp", []);

app.directive("w3TestDirective", function() { return {
    template : "I was made in a directive constructor!"
  };
});

</script>
```

Modules and Controllers in Files

It is common in Angular JS applications to put the module and the controllers in JavaScript files.

In this example, "myApp.js" contains an application module definition, while "myCtrl.js" contains the controller:

Example

```
<!DOCTYPE html>
<html>
<script src="https://ajax.googleapis.com/ajax/libs/Angular JS/1.4.8/angular.min.js"></script>
<body>

<div ng-app="myApp" ng-controller="myCtrl">
{{ firstName + " " + lastName }}
```

```
</div>
<script src="myApp.js"></script>
<script src="myCtrl.js"></script>

</body>
</html>
```

myApp.js

```
var app = angular.module("myApp", []);
```

The [] parameter in the module definition can be used to define dependent modules.

Without the [] parameter, you are not *creating* a new module, but *retrieving* an existing one.

myCtrl.js

```
app.controller("myCtrl", function($scope) {
    $scope.firstName = "John";
    $scope.lastName = "Doe";
});
```

Functions can Pollute the Global Namespace

Global functions should be avoided in JavaScript. They can easily be overwritten or destroyed by other scripts.

Angular JS modules reduces this problem, by keeping all functions local to the module .

When to Load the Library

While it is common in HTML applications to place scripts at the end of the `<body>` element, it is recommended that you load the Angular JS library either in the `<head>` or at the start of the `<body>`.

This is because calls to `angular.module` can only be compiled after the library has been loaded.

Example

```
<!DOCTYPE html>
<html>
<body>
<script src="https://ajax.googleapis.com/ajax/libs/Angular JS/1.4.8/angular.min.js"></script>

<div ng-app="myApp" ng-controller="myCtrl">
{{ firstName + " " + lastName }}
</div>

<script>
var app = angular.module("myApp", []);
app.controller("myCtrl", function($scope) {
    $scope.firstName = "John";
    $scope.lastName = "Doe";
});
</script>

</body>
</html>
```

Angular JS Controllers

Angular JS applications are controlled by controllers.

The **ng-controller** directive defines the application controller.

A controller is a **JavaScript Object**, created by a standard JavaScript **objectconstructor**.

Angular JS Example

```
<div ng-app="myApp" ng-controller="myCtrl">

First Name: <input type="text" ng-model="firstName"><br>
Last
Name: <input type="text" ng-model="lastName"><br>
<br>
Full Name: {{firstName + " " + lastName} }

</div>

<script>
var app = angular.module('myApp', []);
app.controller('myCtrl', function($scope) {
    $scope.firstName = "John";
    $scope.lastName = "Doe";
});
</script>
```

Application

The Angular JS application is defined by **ng-app="myApp"**. The application runs inside the **<div>**.

The **ng-controller="myCtrl"** attribute is an Angular JS directive. It defines a controller.

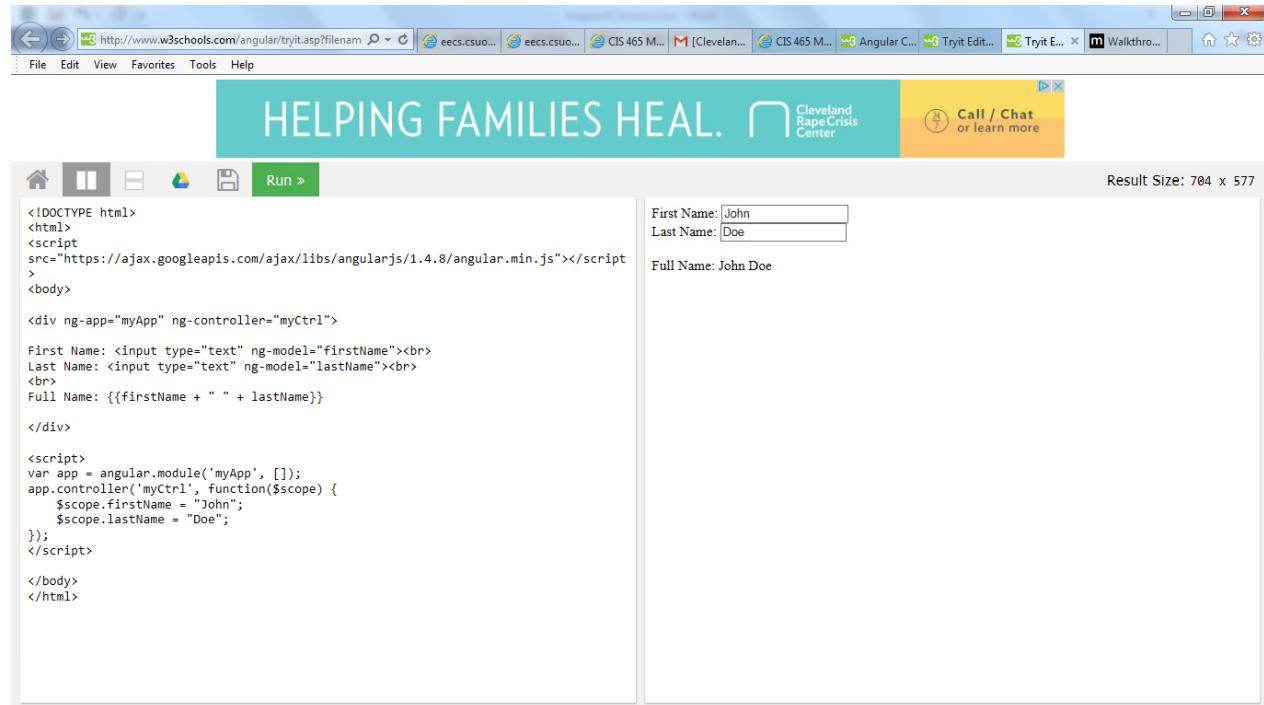

The **myCtrl** function is a JavaScript function.

Angular JS will invoke the controller with a **\$scope** object.

In Angular JS, \$scope is the application object (the owner of application variables and functions).

The controller creates two properties (variables) in the scope (**firstName** and **lastName**).

The **ng-model** directives bind the input fields to the controller properties(firstName and lastName).

```
<!DOCTYPE html>
<html>
<script
src="https://ajax.googleapis.com/ajax/libs/angularjs/1.4.8/angular.min.js"></script>
</body>

<div ng-app="myApp" ng-controller="myCtrl">
First Name: <input type="text" ng-model="firstName"><br>
Last Name: <input type="text" ng-model="lastName"><br>
<br>
Full Name: {{firstName + " " + lastName}}
</div>

<script>
var app = angular.module('myApp', []);
app.controller('myCtrl', function($scope) {
  $scope.firstName = "John";
  $scope.lastName = "Doe";
});
</script>
</body>
</html>
```

Controller Methods

The example above demonstrated a controller object with two properties: lastName and firstName.

A controller can also have methods (variables as functions):

Angular JS Example

```
<div ng-app="myApp" ng-controller="personCtrl">
```

```
First Name: <input type="text" ng-model="firstName"><br>
Last Name: <input type="text" ng-model="lastName"><br>
<br>
```

```
Full Name: {{fullName()}}  
</div>  
  
<script>  
var app = angular.module('myApp', []); app.controller('personCtrl',  
function($scope) {  
    $scope.firstName = "John";  
    $scope.lastName = "Doe";  
    $scope.fullName = function() {  
        return $scope.firstName + " " + $scope.lastName;  
    };  
});  
</script>
```

Controllers In External Files

In larger applications, it is common to store controllers in external files.

Just copy the code between the <script> tags into an external file named [personController.js](#):

Angular JS Example

```
<div ng-app="myApp" ng-controller="personCtrl">  
  
First Name: <input type="text" ng-model="firstName"><br>Last  
Name: <input type="text" ng-model="lastName"><br>  
<br>  
Full Name: {{fullName()}}  
  
</div>  
  
<script src="personController.js"></script>
```

Another Example

For the next example we will create a new controller file:

```
angular.module('myApp', []).controller('namesCtrl', function($scope) {
  $scope.names = [
    {name:'Jani',country:'Norway'},
    {name:'Hege',country:'Sweden'},
    {name:'Kai',country:'Denmark'}
  ];
});
```

Save the file as namesController.js:

And then use the controller file in an application:

Angular JS Example

```
<div ng-app="myApp" ng-controller="namesCtrl">

<ul>
  <li ng-repeat="x in names">
    {{ x.name + ', ' + x.country }}
  </li>
</ul>

</div>

<script src="namesController.js"></script>
```

Angular JS Forms

Forms in Angular JS provides data-binding and validation of input controls.

Input Controls

Input controls are the HTML input elements:

- input elements
- select elements
- button elements
- textarea elements

Data-Binding

Input controls provides data-binding by using the `ng-model` directive.

```
<input type="text" ng-model="firstname">
```

The application does now have a property named `firstname`.

The `ng-model` directive binds the input controller to the rest of your application. The property `firstname`, can be referred to in a controller:

Example

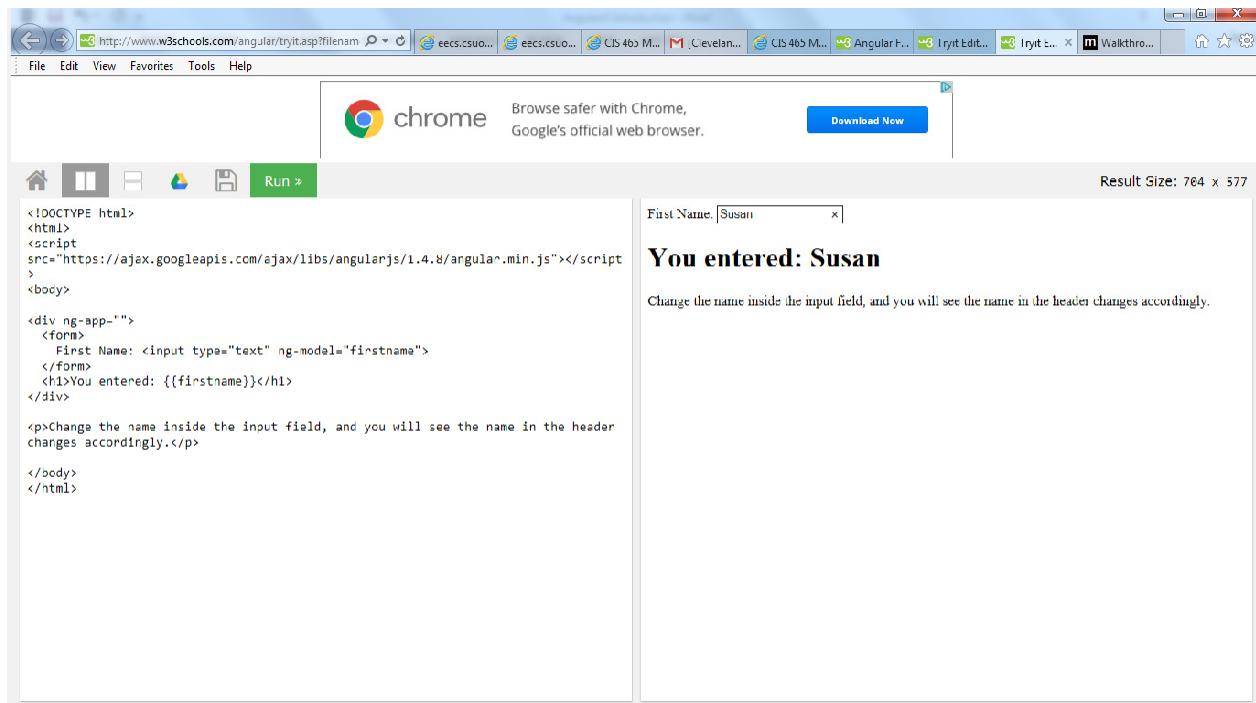

```
<script>
var app = angular.module('myApp', []);
app.controller('formCtrl', function($scope) {
    $scope.firstname = "John";
});
</script>
```

It can also be referred to elsewhere in the application:

Example

```
<form>
First Name: <input type="text" ng-model="firstname">
</form>
```

```
<h1>You entered: {{firstname}}</h1>
```

Checkbox

A checkbox has the value `true` or `false`. Apply the `ng-model` directive to a checkbox, and use its value in your application.

Example

Show the header if the checkbox is checked:

```
<form>
  Check to show a header:
  <input type="checkbox" ng-model="myVar">
```

```
</form>  
  
<h1 ng-show="myVar">My Header</h1>
```

Radiobuttons

Bind radio buttons to your application with the `ng-model` directive.

Radio buttons with the same `ng-model` can have different values, but only the selected one will be used.

Example

Display some text, based on the value of the selected radio button:

```
<form>  
  Pick a topic:  
  <input type="radio" ng-model="myVar" value="dogs">Dogs  
  <input type="radio" ng-model="myVar" value="tuts">Tutorials  
  <input type="radio" ng-model="myVar" value="cars">Cars  
</form>
```

The value of `myVar` will be either `dogs`, `tuts`, or `cars`.

Selectbox

Bind select boxes to your application with the `ng-model` directive.

The property defined in the `ng-model` attribute will have the value of the selected option in the selectbox.

Example

Display some text, based on the value of the selected option <form>

Select a topic:

```
<select ng-model="myVar">
  <option value="">
  <option value="dogs">Dogs
  <option value="tuts">Tutorials
  <option value="cars">Cars
</select>
</form>
```

The value of myVar will be either dogs, tuts, or cars.

An Angular JS Form Example

First Name:

Last Name:

RESET

```
form = { "firstName": "John", "lastName": "Doe" } master =
{ "firstName": "John", "lastName": "Doe" }
```

Application Code

```
<div ng-app="myApp" ng-controller="formCtrl">
  <form novalidate>
    First Name:<br>
    <input type="text" ng-model="user.firstName"><br>
    Last
    Name:<br>
    <input type="text" ng-model="user.lastName">
    <br><br>
    <button ng-click="reset()">RESET</button>
  </form>
<p>form = {{ user }}</p>
```

```
<p>master = {{master}}</p>
</div>

<script>
var app = angular.module('myApp', []);
app.controller('formCtrl', function($scope) {
    $scope.master = {firstName: "John", lastName: "Doe"};
    $scope.reset = function() {
        $scope.user = angular.copy($scope.master);
    };
    $scope.reset();
});
</script>
```

The **novalidate** attribute is new in HTML5. It disables any default browser validation.

Example Explained

The **ng-app** directive defines the Angular JS application.

The **ng-controller** directive defines the application controller.

The **ng-model** directive binds two input elements to the **user** object in the model.

The **formCtrl** controller sets initial values to the **master** object, and defines the **reset()** method.

The **reset()** method sets the **user** object equal to the **master** object.

The **ng-click** directive invokes the **reset()** method, only if the button is clicked.

The **novalidate** attribute is not needed for this application, but normally you will use it in Angular JS forms, to override standard HTML5 validation.

The screenshot shows a browser window with the URL http://www.w3schools.com/angular/tryit.asp?filename=tryit_ng_form. The page content includes an AngularJS code snippet and a form. The form has two input fields: 'First Name' (value: John) and 'Last Name' (value: Doe). Below the form is a 'RESET' button. The browser's status bar indicates 'Result Size: 784 x 577'.

```

<!DOCTYPE html>
<html lang="en">
<script
src="https://ajax.googleapis.com/ajax/libs/angularjs/1.4.8/angular.min.js"></script>
<body>
<div ng-app="myApp" ng-controller="formCtrl">
<form novalidate>
  First Name:<br>
  <input type="text" ng-model="user.firstName"><br>
  Last Name:<br>
  <input type="text" ng-model="user.lastName">
  <br><br>
  <button ng-click="reset()">RESET</button>
</form>
<p>form = {{user}}</p>
<p>master = {{master}}</p>
</div>

<script>
var app = angular.module('myApp', []);
app.controller('formCtrl', function($scope) {
  $scope.master = {firstName:"John", lastName:"Doe"};
  $scope.reset = function() {
    $scope.user = angular.copy($scope.master);
  };
  $scope.reset();
});
</script>
</body>

```

Angular JS AJAX - \$http

http://www.w3schools.com/angular/angular_http.asp

\$http is an Angular JS service for reading data from remote servers.

Angular JS \$http

The Angular JS \$http service makes a request to the server, and returns a response.

Example

Make a simple request to the server, and display the result in a header:

```
<div ng-app="myApp" ng-controller="myCtrl">
```

```
<p>Today's welcome message is:</p>
```

```

<h1>{ {myWelcome} }</h1>
</div>

<script>
var app = angular.module('myApp', []);
app.controller('myCtrl', [
  '$scope',
  '$http',
  function($scope, $http) {
    $http.get("welcome.htm")
      .then(function(response) {
        $scope.myWelcome = response.data;
      });
  }
]);
</script>

```

Methods

The example above uses the `.get` method of the `$http` service.

The `.get` method is a shortcut method of the `$http` service. There are several shortcut methods:

- `.delete()`
- `.get()`
- `.head()`
- `.jsonp()`
- `.patch()`
- `.post()`
- `.put()`

The methods above are all shortcuts of calling the `$http` service:

Example

```

var app = angular.module('myApp', []);
app.controller('myCtrl', [
  '$scope',
  '$http',
  function($scope, $http) {
    $http({
      method : "GET",
      url : "welcome.htm"
    }).then(function mySuccess(response) {

```

```
        $scope.myWelcome = response.data;
    }, function myError(response) {
        $scope.myWelcome = response.statusText;
    });
});
```

The example above executes the \$http service with an object as an argument. The object is specifying the HTTP method, the url, what to do on success, and what to do on failure.

Properties

The response from the server is an object with these properties:

- `.config` the object used to generate the request.
- `.data` a string, or an object, carrying the response from the server.
- `.headers` a function to use to get header information.
- `.status` a number defining the HTTP status.
- `.statusText` a string defining the HTTP status.

Example

```
var app = angular.module('myApp', []);
app.controller('myCtrl', [
  '$scope', '$http',
  function($scope, $http) {
    $http.get("welcome.htm")
      .then(function(response) {
        $scope.Content = response.data;
        $scope.statuscode = response.status;
        $scope.statustext = response.statusText;
      });
  }
]);
```

To handle errors, add one more functions to the `.then` method:

Example

```
var app = angular.module('myApp', []);
app.controller('myCtrl', [
  '$scope', '$http',
  function($scope, $http) {
    $http.get("wrongfilename.htm")
      .then(function(response) {
        $scope.Content = response.data;
        $scope.statuscode = response.status;
        $scope.statustext = response.statusText;
      })
      .catch(function(error) {
        $scope.error = error;
      });
  }
]);
```

```
.then(function(response) {
    //First function handles success
    $scope.content = response.data;
}, function(response) {
    //Second function handles error
    $scope.content = "Something went wrong";
});
});
```

JSON

The data you get from the response is expected to be in JSON format.

JSON is a great way of transporting data, and it is easy to use within Angular JS, or any other JavaScript.

Example: On the server we have a file that returns a JSON object containing 15 customers, all wrapped in array called records.

[Take a look at the JSON object.](#)

customers.php

```
{
  "records": [
    {
      "Name": "Alfreds Futterkiste", "City":
      "Berlin",
      "Country": "Germany"
    },
    {
      "Name": "Ana Trujillo Emparedados y helados", "City":
      "México D.F.",
      "Country": "Mexico"
    },
    {
      "Name": "Antonio Moreno Taquería", "City":
      "México D.F.",
      "Country": "Mexico"
    }
  ]
}
```

```
},
{
  "Name": "Around the Horn", "City":
  "London",
  "Country": "UK"
},
{
  "Name": "B's Beverages",
  "City": "London",
  "Country": "UK"
},
{
  "Name": "Berglunds snabbköp", "City":
  "Luleå",
  "Country": "Sweden"
},
{
  "Name": "Blauer See Delikatessen", "City":
  "Mannheim",
  "Country": "Germany"
},
{
  "Name": "Blondel père et fils", "City":
  "Strasbourg", "Country": "France"
},
{
  "Name": "Bólido Comidas preparadas", "City":
  "Madrid",
  "Country": "Spain"
},
{
  "Name": "Bon app",
  "City": "Marseille",
  "Country": "France"
},
{
  "Name": "Bottom-Dollar Marketse", "City":
  "Tsawassen",
  "Country": "Canada"
},
{
  "Name": "Cactus Comidas para llevar", "City":
  "Buenos Aires",
  "Country": "Argentina"
},
{
  "Name": "Centro comercial Moctezuma", "City":
  "México D.F.",
```

```

        "Country": "Mexico"
    },
{
    "Name": "Chop-suey Chinese", "City":
    "Bern",
    "Country": "Switzerland"
},
{
    "Name": "Comércio Mineiro", "City":
    "São Paulo", "Country": "Brazil"
}
]
}

```

Example

The **ng-repeat** directive is perfect for looping through an array:

```

<div ng-app="myApp" ng-controller="customersCtrl">

<ul>
    <li ng-repeat="x in myData">
        {{ x.Name + ', ' + x.Country }}
    </li>
</ul>

</div>

<script>
var app = angular.module('myApp', []);
app.controller('customersCtrl', [
    '$scope', '$http',
    function($scope, $http) {
        $http.get("customers.php").then(function(response) {
            $scope.myData = response.data.records;
        });
    }
]);
</script>

```

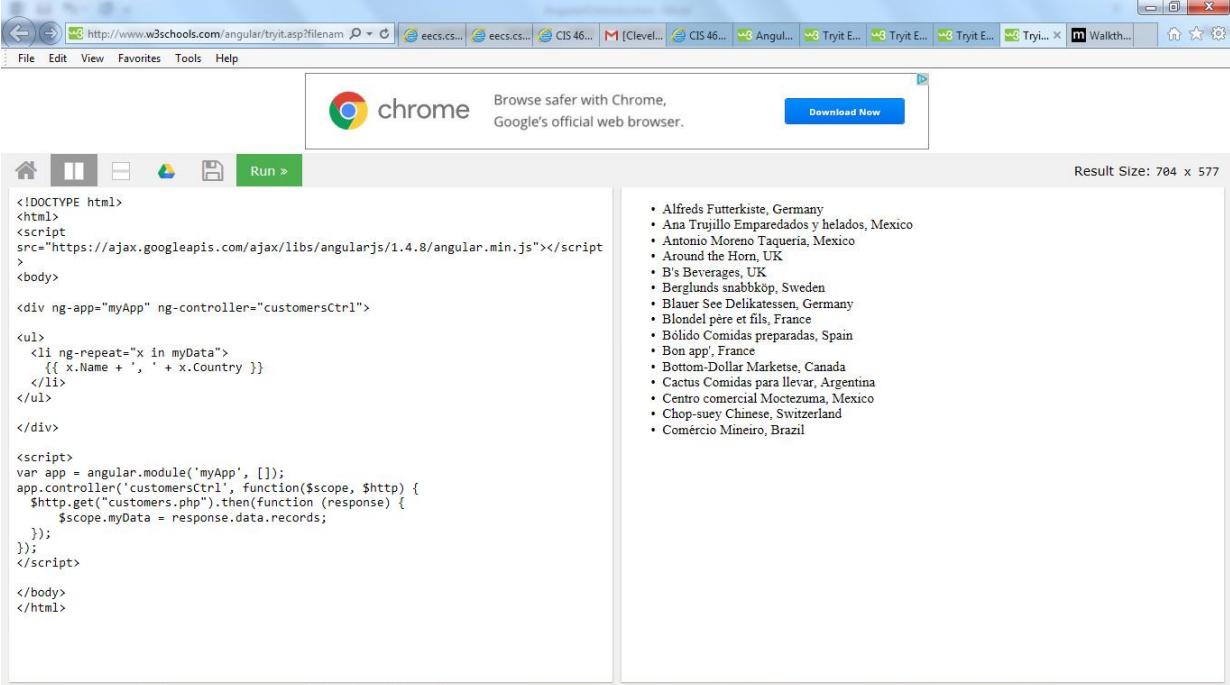

Application Explained:

The application defines the `customersCtrl` controller, with a `$scope` and `$http` object.

`$http` is an **XMLHttpRequest object** for requesting external data

`$http.get()` reads **JSON data** from <http://www.w3schools.com/angular/customers.php>.

On success, the controller creates a property, `myData`, in the scope, with JSONdata from the server.

The screenshot shows a Windows desktop environment. In the center is a Microsoft Edge browser window displaying a local file. The address bar shows the URL: `http://www.w3schools.com/angular/tryit.asp?filename=tryng_http_get`. The browser's title bar also displays this URL. The main content area of the browser shows the AngularJS code and its execution result. On the left, the raw HTML code is visible, including the script tag for `angular.min.js` and the `$http.get` call to `customers.php`. On the right, the execution result is shown as a list of company names and their countries:

- Alfreds Futterkiste, Germany
- Ana Trujillo Emparedados y helados, Mexico
- Antonio Moreno Taqueria, Mexico
- Around the Horn, UK
- B's Beverages, UK
- Berglunds snabbköp, Sweden
- Blauer See Delikatessen, Germany
- Blondel père et fils, France
- Bólido Comidas preparadas, Spain
- Bon app', France
- Bottom-Dollar Marketse, Canada
- Cactus Comidas para llevar, Argentina
- Centro comercial Moctezuma, Mexico
- Chop-suey Chinese, Switzerland
- Comércio Mineiro, Brazil

The browser interface includes standard toolbar icons (Home, Back, Forward, Stop, Refresh) and a status bar at the bottom indicating "Result Size: 704 x 577".

Fetching Data From a PHP Server Running MySQL

Angular JS Example

```
<div ng-app="myApp" ng-controller="customersCtrl">

<table>
  <tr ng-repeat="x in names">
    <td>{ x.Name }</td>
    <td>{ x.Country }</td>
  </tr>
</table>

</div>

<script>
var app = angular.module('myApp', []);
app.controller('customersCtrl', [
  '$scope',
  '$http',
  function($scope, $http) {
    $http.get("http://www.w3schools.com/angular/customers_mysql.php")
      .then(function(response) {$scope.names = response.data.records;});
  }
]);
</script>
```

Fetching Data From an ASP.NET Server Running SQL

Angular JS Example

```
<div ng-app="myApp" ng-controller="customersCtrl">

<table>
  <tr ng-repeat="x in names">
    <td>{ x.Name }</td>
    <td>{ x.Country }</td>
  </tr>
</table>
```

```
</div>

<script>
var app = angular.module('myApp', []);
app.controller('customersCtrl',
function($scope, $http) {
    $http.get("http://www.w3schools.com/angular/customers_sql.aspx")
        .then(function (response) {$scope.names = response.data.records;});
});
</script>
```

Server Code Examples

The following section is a listing of the server code used to fetch SQL data.

1. Using PHP and MySQL. Returning JSON.
2. Using PHP and MS Access. Returning JSON.
3. Using ASP.NET, VB, and MS Access. Returning JSON.
4. Using ASP.NET, Razor, and SQL Lite. Returning JSON.
5. **Cross-Site HTTP Requests**

Requests for data from a different server (than the requesting page), are called **cross-site** HTTP requests.

Cross-site requests are common on the web. Many pages load CSS, images, and scripts from different servers.

In modern browsers, cross-site HTTP requests **from scripts** are restricted to **same site** for security reasons.

The following line, in our PHP examples, has been added to allow cross-siteaccess.

```
header("Access-Control-Allow-Origin: *");
header("Access-Control-Allow-Origin: *");
```

Server Code PHP and MySQL

```
<?php
header("Access-Control-Allow-Origin: *"); header("Content-Type:
application/json; charset=UTF-8");

$conn = new mysqli("myServer", "myUser", "myPassword", "Northwind");

$result = $conn->query("SELECT CompanyName, City, Country FROM Customers");

$outp = "";
while($rs = $result->fetch_array(MYSQLI_ASSOC)) {if
    ($outp != "") {$outp .= ",";}
    $outp .= '{"Name":"' . $rs["CompanyName"] . '",';
    $outp .= '"City":"' . $rs["City"] . '",';
    $outp .= '"Country":"' . $rs["Country"] . '"';
}
$outp ='{"records":['.$outp.']}';
$conn->close();

echo($outp);
?>
```

Server Code PHP and MS Access

```
<?php
header("Access-Control-Allow-Origin: *");
header("Content-Type: application/json; charset=ISO-8859-1");

$conn = new COM("ADODB.Connection");
$conn->open("PROVIDER=Microsoft.Jet.OLEDB.4.0;Data Source=Northwind.mdb");

$rs = $conn->execute("SELECT CompanyName, City, Country FROM Customers");

$outp = "";
while (!$rs->EOF) {
    if ($outp != "") {$outp .= ",";}
    $outp .= '{"Name":"' . $rs["CompanyName"] . '",';
    $outp .= '"City":"' . $rs["City"] . '",';
    $outp .= '"Country":"' . $rs["Country"] . '"';
    $rs->MoveNext();
}
$outp ='{"records":['.$outp.]
```

```
$conn->close();
```

```
echo ($outp);  
?>
```

Server Code ASP.NET, VB and MS Access

```
<% @ Import Namespace="System.IO"%>  
<% @ Import Namespace="System.Data"%>  
<% @ Import Namespace="System.Data.OleDb"%>  
<%  
Response.AppendHeader("Access-Control-Allow-Origin",      "*")  
Response.AppendHeader("Content-type", "application/json")Dim conn  
As OleDbConnection
